Hydropower Development In The Mekong

File Type PDF Hydropower Development In The Mekong Region Political Socio Economic And Environmental Perspectives Earthscan Studies In Water Resource Management

The single most significant impact—both now and in the future—on the use of water and its management in the Mekong Region is hydropower. Given current development trends in the region, power demands are expected to rise seven percent per year between 2010 and 2030, yielding a substantial and potentially lucrative energy market. Hydropower is the favoured energy option for the Mekong's riparian countries.

Hydropower in the Mekong River Basin - Wikipedia

Agreements have been signed with developers for 12 hydropower projects on the lower sections of the Mekong River. But without proper planning, dam development can seriously harm the environment, and the people dependent on the mighty Mekong. Damming the Mekong will: impact the region's natural monsoonal flood/drought cycles

Hydropower development in the Greater Mekong | WWF

The Mekong Basin is home to some 70 million people, for whom this great river is a source of livelihoods, the basis for their ecosystems and a foundation of their economies. But the Mekong is also currently undergoing enormous social, economic, and ecological change of which hydropower development is a significant driver.

The Mekong River is one of the world's last large rivers remaining mostly undammed. But China is constructing a series of eight hydropower projects on the upper Mekong.

Mekong Hydropower Development | Science

An increase in power demand, volatile prices in international energy markets and concerns over carbon emissions have intensified interest in hydropower development – the Mekong's indigenous renewable energy resource. The debate on hydropower development in the Lower Mekong Basin is however, an emotive topic. Perspectives range from a moratorium on all projects to a green light for development to boost national economic growth.

Sustainable Hydropower » Mekong River Commission

The impacts of river damming on nutrient retention and ecosystem production have become a serious environmental issue in rivers and often cause tensions between nations along trans-boundary rivers, including the Mekong River [3, 9, 10], which seriously constrains the sustainable development of hydropower. The Mekong River (named the Lancang River in China) originates in the Tibetan Plateau at an altitude of about 5200 m and flows 4909 km southeast to the South China Sea, through six ...

File Type PDF Hydropower Development In The Mekong Region Political Socio Economic And Environmental Perspectives Earthscan Studies In Water Resource Management

The model of hydropower development being pursued in the Mekong is cascades of dams, where each dam spills directly into the next downstream pondage. This model, widely applied in China, maximizes the potential electricity yield, but it also maximizes the negative environmental and social impact of dams.
